Compsns. comprising lymphoid surface membrane proteins - which may inhibit yet/olytic activity and differentiation of CTLs.  Example: Page 12: 29pp; English and inferentiation of CTLs.  Example: Page 12: 29pp; English . This sequence represents the HAN-B2702 84-79-84 palindrome. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein p74 from a T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the hear shock protein HSC70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable expressed on B and T cells. p74 can be isolated by lysis of a suitable coll with a mamphoteric detergent, and then passed through an affinity column containing a covalently bound HA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HA-B2702 60-84 (see R99416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of determining the amount of binding between the candidate composition of CTL activity can be inhibited in a cellular composition mix the extracellular portion of p74 in an amount sufficient to compete with p74 for the binding of the p74 ligand.

New immunomodulating dimer peptide(s) - based on a Class I HLA-B PT New immunomodulating dimer peptide(s) - based on transplants or treating autoimmune diseases

Fracting autoimmune diseases

CC Peptides W33784-98 and W33778-9 were assayed for their immunomodulating activity, heptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or compensed forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = CC (R aa76-771) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = CC or Small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid; aa82 = R or L; aa83 = G or R; and a represents amino acid; account of the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HLA-B alphal domain (positions or undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CDS. The peptide can be used for preventing rejection of transplants or for treating autcommune diseases, e.g. dlabetes, consense for detection and diagnosis. The products can also be sensed for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä

claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and a represents amino acid; The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLS. They can also inhibit the proteins of interest to activate CTLS. They can also inhibit the close of the proteins of interest to activate CTLS. They can also inhibit autoimmune diseases, e.g. daabetes, rheumatoid arthritis and lupus erythematosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702.
These sequences can be used to extend the period of acceptance by a reclipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HLA-B2702 CTL modulating peptide (B2702.84-75/75-84).

Krensky AM;

PRI 195-194027/25.

Compsns. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

Example: Page 12: 29pp; English.

Example: Page 12: 29pp; English.

R95413, and R95415-R9543 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the LHA-B2702 84-75-84 palindrome. These sequences can be used to isolate the protein p74 from a T-cell activation in mammalian T-cells, and is protein associated with T-cell activation in mammalian T-cells, and is protein associated with T-cell activation in mammalian T-cells, and is protein massociated number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcum influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of etermining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition mix the extracellular portion of p74 and and mix the extracellular portion of p74, in an amount sufficient to compete containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete containing the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ü

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime modulate (or limited) period of the cyptotoxic I lymphocytes (CTLs) of the patient.
formation of biomass or a desired product, e.g. the product may be lactic acid which results in the acidification of dairy products. The method is more efficient than currently used methods of biomass production. Sequence 469 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                HIA-B2702 CTL modulating peptide (B2702.84-75/75-84(T)).
Yototoxic T lymphocyte; CTL; major histocompatibility complex; MHC;
immunosuppressant; graft versus host disorder; transplantation; therapy;

Wet; servenosuouves.

Pur menunomodulating dimer peptide(s) - based on a class I HIA-B
alpha-1 domain, used for preventing rejection of transplants or
alpha-1 domain, used for preventing rejection of transplants or
by treating autofimmune diseases.

Example 1; Page 19; 41pp; English.

Example 1; Page 19; 41pp; English.

Peptides W3384-98 and W33778-9 were assayed for their immunomodulating activity, including the N-terminal acylated and/or
criminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B =
CC (R a376-771) (a379-44) or (a384-79) (Laa77-76R); aa76 = E or V; aa77 =
CD, S or N; aa79 = R or G; aa80 = I or N; aa81 = a hydrophobic or
Small amino acid; aa82 = R or L; aa83 = G or R; and as represents amino
acid. The sequence in the brackets may optionally be absent or truncated
at any peptide type bond within the brackets. The compounds comprise
at any peptide type bond within the brackets. The compounds comprise
canino acid sequences related to a Class I HIA-B alphal domain (positions)
79-84). They can be used to inhibit cyctoxic I-lymphocytes (CIL) from
undesirably attacking cells in a host or in vitro. They can also be
used in combination with antigenic peptides or proteins of Interest to
activate CILs. They can also inhibit the proliferation of T cells in
response to anti-CD3. The peptide can be used for preventing rejection
cof transplants or for treating autoimmune diseases, e.g. diabetes,
cused for detection and diagnosis. The products can also be
considered.

Example 10 or 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ü
                                                                                                                                                                                                                           Example 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R82907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702.
These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to.a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               19-JUN-1998 (first entry)
Peptide B2702.84-75r/75-84 tested for immunomodulating activity.
Immunomodulating dimer; immunosuppressant drug; CTL activation; transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
                                                                                                Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

While Strangerising lymphoid surface membrane proteins - which may thinbit cytolytic activity and differentiation of CTLs.

Example 12. 29pp. English.

Example 12. 29pp. English.

R95413, and R95415-R9543 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the card range of the Partol 84-77-84 palindrome. These sequences can be used too isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein p74 from a T-cell lysate. p74 is a T-cells, and is also immunologically cross reactive with the heat shock protein Rsc70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphorteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis.

Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCs), by sequence 20 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            obesity or bulimia

Canine Y5 receptor (R95940), isolated as an 'atypical Y1
receptor. The receptor belongs to the G protein-coupled receptor
superfamily. It is encoded by a cDNA clone (see also T30435) that
was isolated by PCR amplification using primers (T30436-37) based
on human and rat cDNA clones (T30433-34). Recombinant canine Y5
receptor can be produced in prokaryotic or eukaryotic (e.g. COS,
293 or Sf9 insect) host cells. It is used to identify Y5 ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Canine IS receptor.

YS receptor; atypical neuropeptide Yl receptor; feeding behavior;
YS protein coupled receptor; agonist; antagonist; obesity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding canine hypothalamic atypical neuro:peptide Y/peptide YY receptor, Y5 - useful for identification of compounds which are apable of modifying feeding behaviour capable of modifying feeding behaviour capable of modifying feeding behaviour.

PS Claim 5; Fig 15; 273pp; English.

Claim 5; Fig 15; 273pp; English.

The sequence is that of a Y5 receptor (Y5-R).

The sequence is that of a Y5 receptor (Y5-R).

The sequence or reduce the activity of a Y5-R. In particular, inhibitors can be used to reat obesity and activity of a Y5-R. In particular, inhibitors can be used to treat obesity and activators can be used to treat anorexia. Antagonists capable of alleviating (by decreasing the activity of Y5-R) an abnormality can be identified by administering whether the substance alleviates the physical and behavioural abnormalities displayed by the transgenic mammal as a result of overactivity of a Y5-R. Agonists can be identified in a similar manner, but where the abnormality is alleviated by increasing the activity of but where the abnormality is alleviated by increasing the activity of the content of

C;Comment: This enzyme, located in peroxisomes, catalyzes the oxygen-specific oxidation
this reaction is the initial step of the peroxisomal beta-oxidation system. In C. trop
gene family.
C;Comment: The peroxisomes are eukaryote subcellular organelles that generate and degrad
ic reactions as well as the enzymes involved are usually different from the mitochondria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     acyl-CaA oxidase (EC 1.3.3.6) PXP2, peroxisomal - yeast (Candida tropicalis)

Regul. Pept. 75:45-53(1998).
-!- FUNCTION: RECEPTOR FOR NEUROPEPTIDE Y AND PEPTIDE YY. THE ACTIVITY
OF THIS RECEPTOR IS MEDIATED BY G PROTEINS THAT INHIBITS ADBNYLATE
CYCLASE ACTIVITY. SEEMS TO BE ASSOCIATED WITH FOOD INTAKE. COULD
BE INVOLVED IN FEEDING DISORDERS (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
HIGHEST TO TACHYKININS RECEPTORS.
                                                                                                                                                                                       Gaps

-! FUNCTION: RECEPTOR FOR NEUROPEPTIDE Y AND PEPTIDE Y: THE ACTIVITY

OF THIS RECEPTOR IS MEDIATED BY G PROTEINS THAT INHIBITS ADENYLATE

CYCLASE ACTIVITY. SEEMS TO BE ASSOCIATED WITH FOOD INTAKE. COULD

BE INVOLVED IN FERDING DISORDERS (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANT PROTEIN.

-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

HIGHEST TO TACHYKININS RECEPTORS.
                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                        WRAITH A., TORNSTEN A., CHARDON P., HARBITZ I., CHOWDHARY B.P., ANDERSON L., LARHAMMAR D.;

**NOTE: This is a "vorking draft, sequence. It currently
** consists of 28 contigs. The true order of the pieces
** is not known and their order in this sequence record is
** arbitrary. Gaps between the contigs are represented as
** runs of N, but the exact sizes of the gaps are unknown.
** This record will be updated with the finished sequence
** as soon as it is available and the accession number will
** be preserved.

Opioid receptor.
Homo sapiens female placenta cDNA to mRNA.
Homo sapiens
Eukaryota: Metazoa; Chordata; Craniata; Vertebrata; Mammalia;
Butheria: Primates; Catarrhin; Hominidae; Homo.
1 (Dases 1 to 4839)
Goldstein,A., Xie,G.-X. and Miyajima,A.
Expression cloning of CDNA encodding a seven-helix receptor from human placenta with affinity for opioid ligands
Proc. Natl. Acad. Sci. U.S.A. 89, 4124-4128 (1992)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         27-APR-1993

Saccharomyces cerevisiae
Eukaryota: Fungi: Ascomycota; Saccharomycetales;
Saccharomycetacee; Saccharomyces.

1 (bases 1 to 5056)
MONITION.A. Christensen,R.B., Alley,J., Beck,A.K., Bernstine,E.G.,
Lemontt,J.F. and Lawrence,C.W.
REV3, a Saccharomyces cerevisiae gene whose function is required
for induced mutagenesis, is predicted to encode a nonessential DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /translation="mSRESNDTIQSDTVRSSSKSDYFRIQLNNQDYYMSKPTFLDPSH

current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones.
Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

IMPORTANT: This sequence is not the entire insert of clone E02Al0. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone C14Cl0 is at 23796 in this sequence. The true right end of clone F45D3 is at 107 in this sequence. The strue india of clone F45D3 is at 107 in this sequence. The start of this sequence (1. 108) overlaps with the end of close E78063.

The end of this sequence (23793. 23889) overlaps with the start of sequence E78063.
                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Nematoda; Secernentea; Rhabditia; Rhabditida;

Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

Exceptions are indicated by an explicit note. Imporrant: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

It may be shorter because we only sequence overlapping sections once, or longer because we only sequence overlapping sections once, or longer because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                Eukaryota; Metazoa; Nematoda; Secernentea; Rhabditia; Rhabditida;
